

No. 31.

An Introductory Information Leaflet on the **Royal Python**

(*Python regius*)

(and other small pythons and boas.)

Europe's Premier
Reptile Product Company

Background Heat

Use a heat mat between half and two thirds the size of the cage to provide background heating. The hottest spot in the cage should not be above 32°C while the coolest should not be below 25°C.

Use a *HabiStat Mat - Stat* if the temperature is too hot but put the whole cage in a cooler place if the temperature is not cool enough.

Food: Items like defrosted frozen rodents are ideal. Occasionally a defrosted frozen chick could be offered to give variety. Do not feed anything of unknown or dubious history such as wild or pet rodents or cat and road kills.

Cleanliness and Hygiene: A routine cleaner for all non-porous surfaces could be *Vetaclean* followed by a thorough rinse. Anything that cannot easily be cleaned should be thrown away and replaced. Any little graze or blemish on the animals themselves would benefit from the first aid afforded by dabbing the wound with *Vetadine*. As far as human hygiene is concerned, *Vetasept Surgical Scrub* will clean hands and surfaces while *Vetasept Hand Rub* will allow adequate cleansing and disinfection even in cases when water is unavailable.

Cages
Suitable for a
Pet Royal
Python

Lights: Snakes do not seem to need artificial lights when kept as pets. They will thrive in cages illuminated with just the room lights. Either a spot or fluorescent lamp could be added as an optional extra.

Optional Hot Spot

A local area of higher temperature can be created, if desired, with a ceramic heater or basking spot lamp. Use them in conjunction with the appropriate *HabiStat* thermostat for precise control. Hot spots should be maintained for the same day length as the lights, fourteen hours in summer, eight in winter. Or use a *Sun Switch* for day/night and seasonal timing

Simple set up for beginners: A moulded plastic cage is set up with a heat mat taped to the base or side. The mat should be about half the size of the cage. On to the floor of the cage, *Rain Forest Substrate*, *Repti-Sand* or *Savannah Substrate* is spread a very thin layer of no more than 1 cm. (A thicker layer will act as an insulator and block the heat from the mat.) Check with a thermometer that the cage is within the acceptable temperature range. *Cork Bark* could

be used to make hide or a *Repti-rock* cave could be used. A *Repti-rock* water dish would be the only other essential. When satisfied everything is OK, add the snake!

Cage Set Up

The cage should be set up to allow an active snake plenty of scope to climb, bask in a warm spot, move to a cooler place, drink and look for food. The snakes should also be able to secrete themselves in a refuge or rub themselves against something when shedding their skin.

Cage Decor: Use *Rain Forest Substrate*, *Repti-Sand* or *Savannah Substrate* as a base as these will blot up and 'clump' any fouling by the snakes. Clumps of waste can then be removed without cleaning the whole tank out. *Cork Bark* could be used to make an interesting three dimensional display. While draping *Repti-Vines* in the cage will provide refuges the snakes can hide in or move through to loosen shedding skin. *Repti-rock* caves and water dishes would lend even more functionality and security.

Shopping List

Not every thing is needed to begin with, usually one item from each of the categories marked •. Try alternatives as your collection and experience grows. A basic minimum is given to help decide what options to add.

- **Plastic Vivaria**
- **HabiStat, Heat Mats** 6x11/7w
- **Rain Forest Substrat**
- **Repti-rock Dishe, Hide & Cave**
- **Thermometer**
- **Melamine Vivaria Vivarium Lids**
- **HabiStat, Heat Mats** (6x11/7w, 11x11/12w, 17x11/20w, 23x11/28w, 29x11/35w, 35x11/42w & 49x11/55w) & **Strips** (17x6/10w, 23x6/15w, 35x6/22w & 47x6/30w)
- **Black Magic Ceramic Heaters** (60w, 100w, 150w, 250w, Reflectors & Holders)
- **Basking Spot Bulbs Ordinary, Day & Red Night Types** 100 w & 60w + Lamp holder and Lead
- **Thermometers** (Alcohol, dial, minimum - maximum & electronic digital)
- **Hygrometers** (Dial & electronic digital)
- **HabiStat Thermostats** (Mat-Stat/100w, Temperature/300w, Twin/2x300, Pulse Proportional/600w, Dimming/600w & Night Time Drop Function)
- **HabiStat Light Switches** Sun & Moon Switches or Night Eye
- **HabiStat Cool Control & MiniFan**
- **Repti-Vines**
- **Savannah Substrate**
- **Desert Substrate**
- **Cork Bark**
- **Reptile D₃ Lights** (18"/15w & 24"/18w)
- **Arcadia Control Units** (15w, 2x15w, 18w & 2x18w)
- **Frozen Rodents**
- **Reptavite**
- **Reptasol**
- **Vetaclean**
- **Vetadine**
- **Vetasept Surgical Scrub**
- **Vetasept Hand Rub**
- **Books & Leaflets**

Royal Pythons...

...Housing

Many types of cage can be used to house snakes. For hatchlings and small juveniles, the moulded clear plastic tanks with a fitted lids are very useful. For other animals the purpose made vivaria are probably more appropriate. The types with sliding glass doors to the front being especially resistant to escape. Another often used cage is a converted aquarium. A special adapting lid is used to contain the reptiles and house any equipment that may be used. It may be convenient to keep small to medium sized specimens in such cages but bigger animals will be able to push the lid off!

The cage may not have to be huge as many specimens seem to thrive in quite modest cages. The sum of the of the cage length and width should be longer than the total length of the snake. Of course, the cage could be larger as this would allow the animal room to grow and make it easier for the owner to manage the environment.

The cage should be set up in a manner similar to the diagram overleaf. If done correctly it will be warmest next to the mat at about 32°C, while the coolest part of the cage could be nearer 25°C. A specific hot spot can be installed to operate during the day. Light should be present for a similar period; about fourteen hours in summer dropping to eight in winter.

Much of the success achieved in keeping these snakes will come from the skilful manipulation of ventilation. Royal Pythons enjoy high humidities yet they cannot stand stagnant or airless conditions. Fresh air moving into the cage is essential. Use the upward draughts caused by heated air rising to flush out the cage and drag fresh air in. A more sophisticated solution would be to use a *MiniFan* to ventilate the cage

...Husbandry

It is best to keep most snakes on their own as they are easier to manage singly. Adult pairs will often live together quite happily but may need supervision at feeding time. One snake may inadvertently eat another if they both start on the same food item. In any case, it is advisable not to mix species or specimens of widely differing size in the same cage as this will avoid accidents!

To handle a snake, the whole animal should be gently grasped and held in the hands. Let it move through the hands but do not grasp it too tightly or let it coil around the handlers neck. The hands should provide support and restraint is applied by slowing down but not stopping the flow of movement. Royal pythons will curl up into a tight ball when threatened, hence their alternative nam of "Ball Python". Once tame this behaviour is soon lost.

As everything recommended for the cage is washable or disposable, a good clean out is easily done. The cage set up advised in this leaflet is practicable and can be made to look pleasing to the eye. If a more natural set up is envisaged, one with growing plants for example, it may be as well to wait until some experience is gained. In any case, some of the very informative books on snakes could be investigated.

...Food & Feeding

Feed the snakes once each week as adults and a little more frequently if younger. Feed one or two items that can be eaten in five to ten minutes. In the wild mice, rats and other mammals with a few small birds will make up the bulk of the diet. Defrosted frozen mice, ranging in size from pinkies to adults could be offered or even small rats if taken. These frozen foods may have to be offered warm. They are better than freshly killed animals as many of the parasites affecting snakes are killed by being frozen. In captivity a compromise may have to be made as a

totally natural diet is neither readily available nor the type of food many people would be happy offering.

Royal pythons have the reputation for being fussy feeders and some individuals may prove tricky. All pet royal pythons should be taking defrosted rodents when sold. It is beyond the scope of beginners and those keeping pet snakes to train a reluctant feeder.

A water dish kept full of fresh water should always be available. This dish should be quite small so that the snake can drink but makes total immersion difficult. A larger bathing dish can be supplied for a few hours, a couple of times each week. Damp and wet conditions lead to skin ulceration and other diseases.

...Reproduction

To sex these snakes look at the tail of the animal. In males there is a hemipenal bulge posterior to the vent. The males are also generally smaller and slimmer and have longer, slightly thicker tails. Either side of the vent are two small claw like limb vestiges. These are bigger and more obvious in males. To get a definitive sexing, ask someone with adequate experience to probe the snake.

A robust courtship usually preludes mating and eggs are produced several weeks later. Royal Pythons are not, however, likely to breed in captivity without a winter rest. Read up on the more advanced aspects of keeping snakes if breeding is anticipated.

Captive bred babies are commonly available and among these specimens, a few colour variations are now offered for sale. These are not different species but mutations, usually with one or more individual pigments missing or showing an altered pattern.

...Health & Disease

These snakes live for several decades in captivity so a long term relationship should be prepared for. The captive animal is quite different from its wild cousins. They suffer from few diseases and veterinary attention is rarely needed. An environment and diet as described in this leaflet will preclude most problems. Good practice, hygiene and first aid will probably deal with the rest. If real disease is discovered, a vet must of course, be consulted. Pet snakes do not pose a real threat to human health. All the normal hygiene precautions regarding humans and animals should, however, be observed.

Four problems probably account for 90% of all captive disease. The first relates to skin and eye problems caused by dirty conditions. Small abscesses occur under the scales and eyes are often inflamed. Damp or wet conditions exacerbate the situation and the disease is avoidable if the cage is completely dry. In spite of them enjoying a bath, they cannot tolerate being wet for prolonged periods.

The second common disease is an infection of the respiratory tract. The snake will 'wheeze', gape and even sneeze. A frothy mucus will also be commonly discharged from the mouth. Raising the cage temperature may alleviate the distress but veterinary intervention is the only real remedy.

Sometimes a snake will be found to have a mouth infection, and this is the third of the most frequently seen problems. A cheesy mass may be seen in the mouth and soreness of the tissue is also common. The symptom of 'mouth rot', *necrotic stomatitis*, is indicative of a more general infection and veterinary advice must be sought. The last, concerns the occasional infestation with ticks or mites. A separate leaflet explains how to cope with these easily avoided pests.
